

Proposal: Minimizing Transportation costs & Maximizing Speed to Customer

Fractal Analytics

24th October 2018

Our understanding of your business requirements

Current scenario

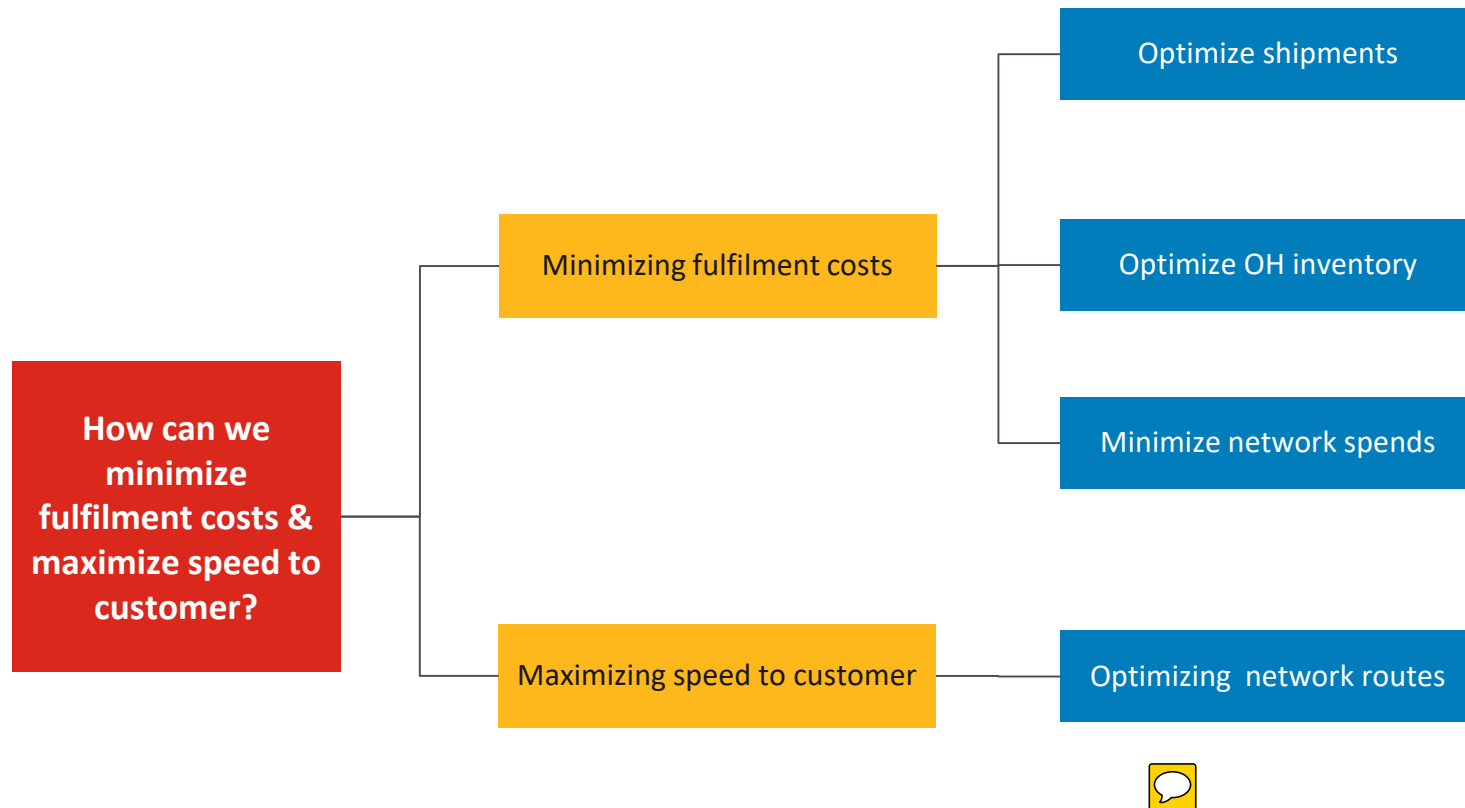

- In current supply chain, SKUs flow from multiple vendors through **3 centralized fulfilment centers** and then to **700 (approx.) store locations**
- **Only 30% of products** are fulfilled by replenishment policies
- **Buy Online, Pickup in Store (BOPIS)** policy is based on current availability of inventory at store
- **Promotions** are often carried out **sporadically** to drive the sales throughout the year & move excess inventory
- In case of home delivery to customer – **promise date** is 5 days

What's the need?

- The business objective is to **minimize fulfillment & shipping costs**
- **Maximize the speed to customer**
- DCSG wants **inventory optimization** for all e-Commerce sales and all categories
- **Primary focus on 70% of products** which don't have any replenishment policies
- Integrate the consumption layer of solution with existing JDA Allocation system

We will follow a structured problem solving approach to minimize fulfilment costs & maximize speed to customer

Use cases

- 1. Cost drivers for sub-optimal shipments
- 2. Store profiling

- 3. Grouping orders for FTL shipments
- 4. Line items to be shipped in same delivery window

- 5. Determine minimum stock at Store level
- 6. Recommend store replenishment frequency & quantity

- 7. Optimize VFR for FTL & LTL
- 8. Optimize carrier selection

- 9. SKU profiling at DC level & Like item shipments

- 10. Determining the right DC with the right OH for the SKUs

- 11. Determining no. of trucks needed for next week demand

- 12. Determining optimal transit days

Phase 1

Phase 2

* We have prioritized the specific use cases in Phase 1 basis the high level understanding of the requirements

Phase 1

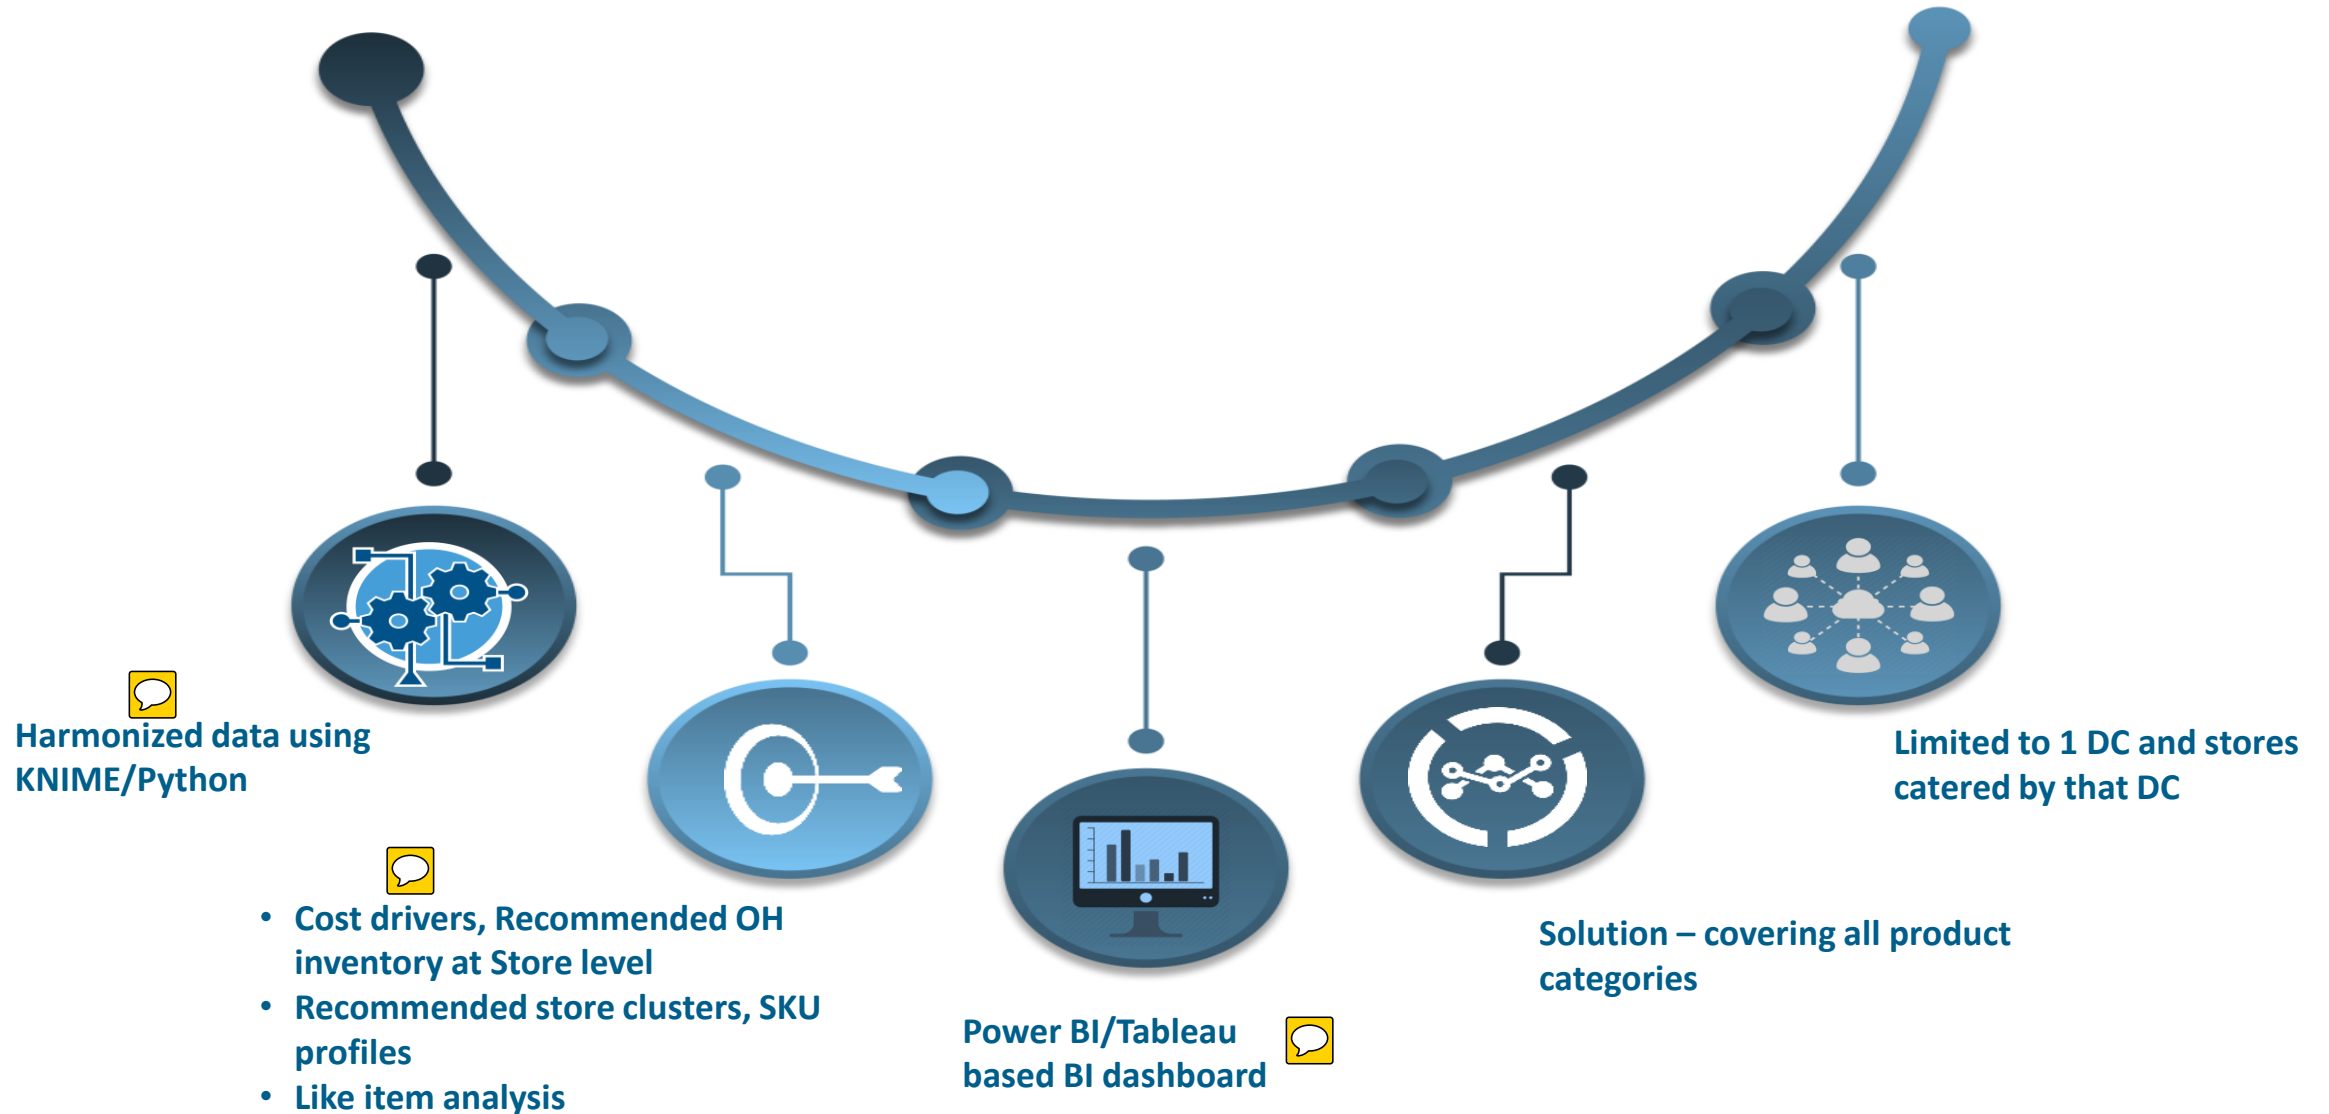

We will explore and deploy the right analytical techniques for each use case (Phase 1)

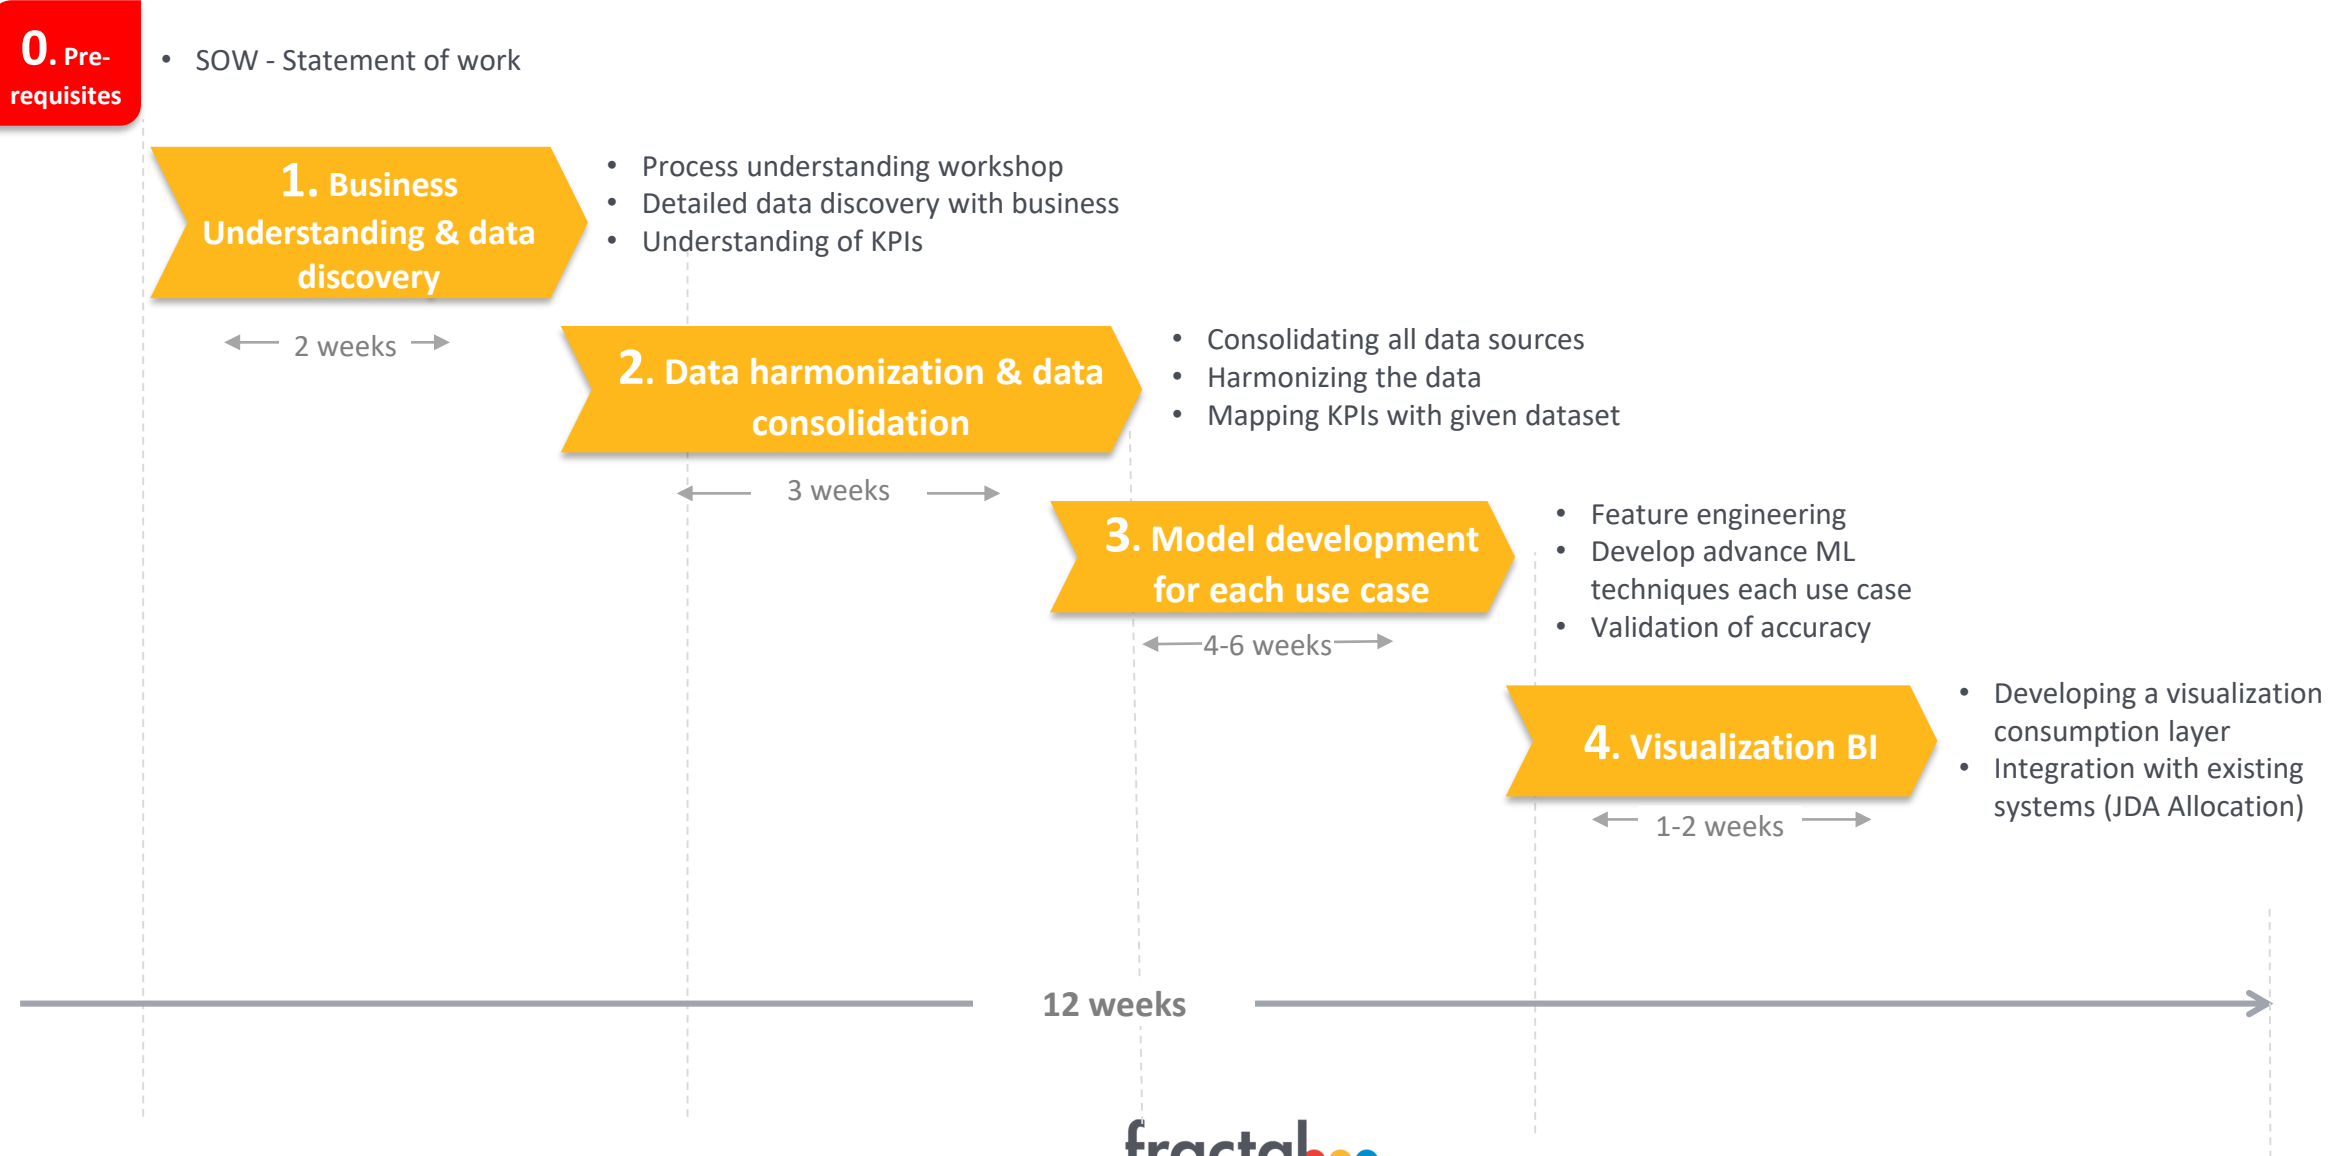

Use cases	1. Cost drivers for sub-optimal shipments	2. Store profiling	5. Minimum stock at store level 6. Recommend replenishment frequency/quantity at stores	9. SKU profiling at DC level & Like item shipments
Potential Drivers/ input variables <i>(not exhaustive)</i>	<ul style="list-style-type: none"> Historical shipments by customer, stores, regions Total demand Shipping cost per item 	<ul style="list-style-type: none"> Annual demand OH inventory Historical shipments/orders Promo volumes 	<ul style="list-style-type: none"> Annual demand Transit lead time Inventory unit cost of item Buying cost of item OH inventory 	<ul style="list-style-type: none"> Historical shipments by customer, stores, regions, DC Total demand Inventory unit cost of item OH inventory
Analytical techniques & models	<ul style="list-style-type: none"> Driver analysis using – Bayesian network Demand profiling & segmentation 	<ul style="list-style-type: none"> Clustering based on channels, volume, capacity, demand, product attributes SVM classification 	<ul style="list-style-type: none"> Multi criteria inventory classification Inventory optimization by arriving at economic order quantity & re-order points 	<ul style="list-style-type: none"> Classification using Naive Bayes & SVM Product association rules
Output <i>(indicative)</i>	<ul style="list-style-type: none"> Products shipped sub optimally Freight costs matrix by region, customers, stores 	<ul style="list-style-type: none"> Optimal set of store clusters to be catered together 	<ul style="list-style-type: none"> Optimal ordering & replenishing quantity Re-ordering point Min level or safety stock 	<ul style="list-style-type: none"> Set of strategic & profitable SKUs Right SKU at right DC SKUs which can be shipped together

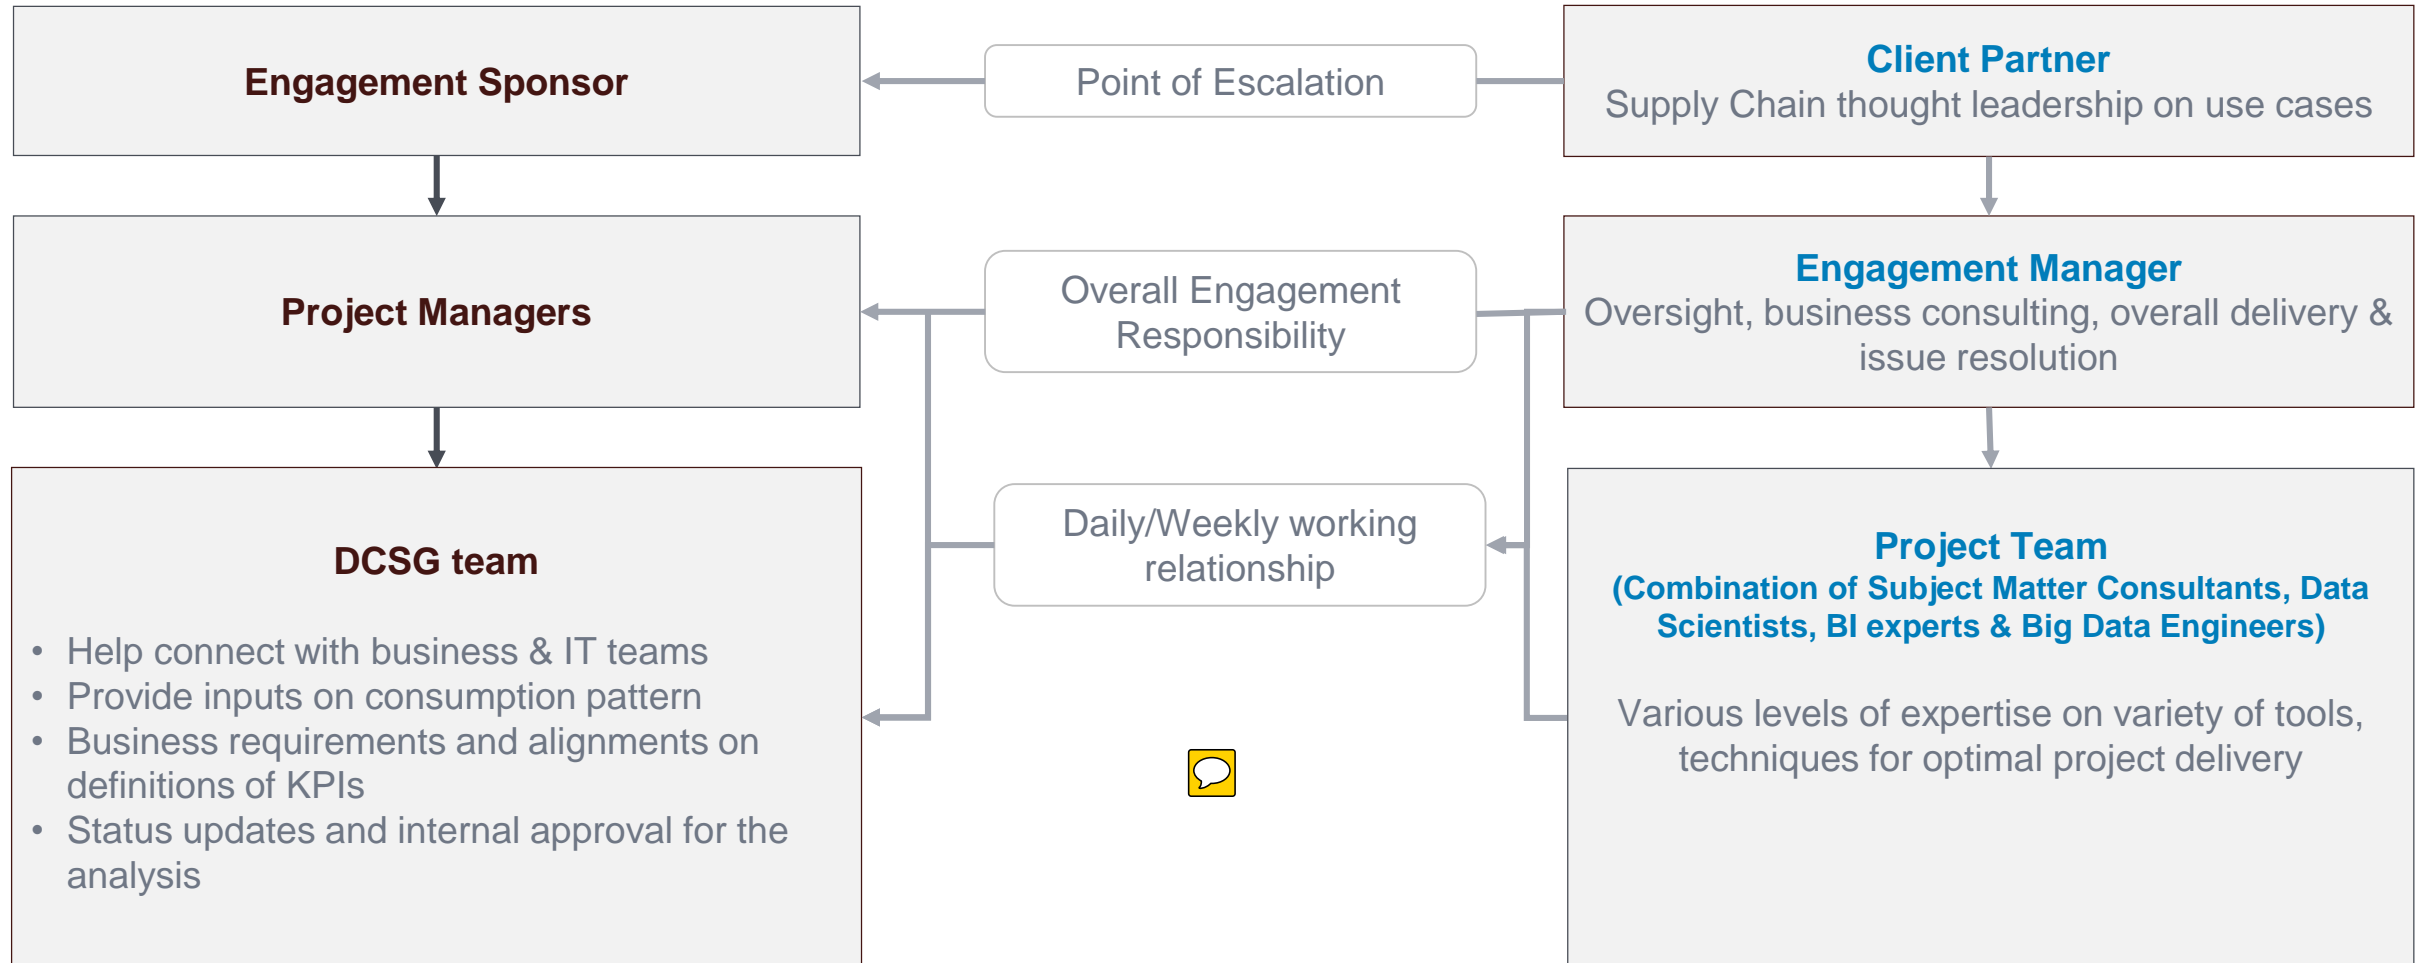

And deliver the following to DCSG

Phase 1 Project Plan

Our proposed engagement model during Phase 1

Commercials

Project Cost: US \$190,000

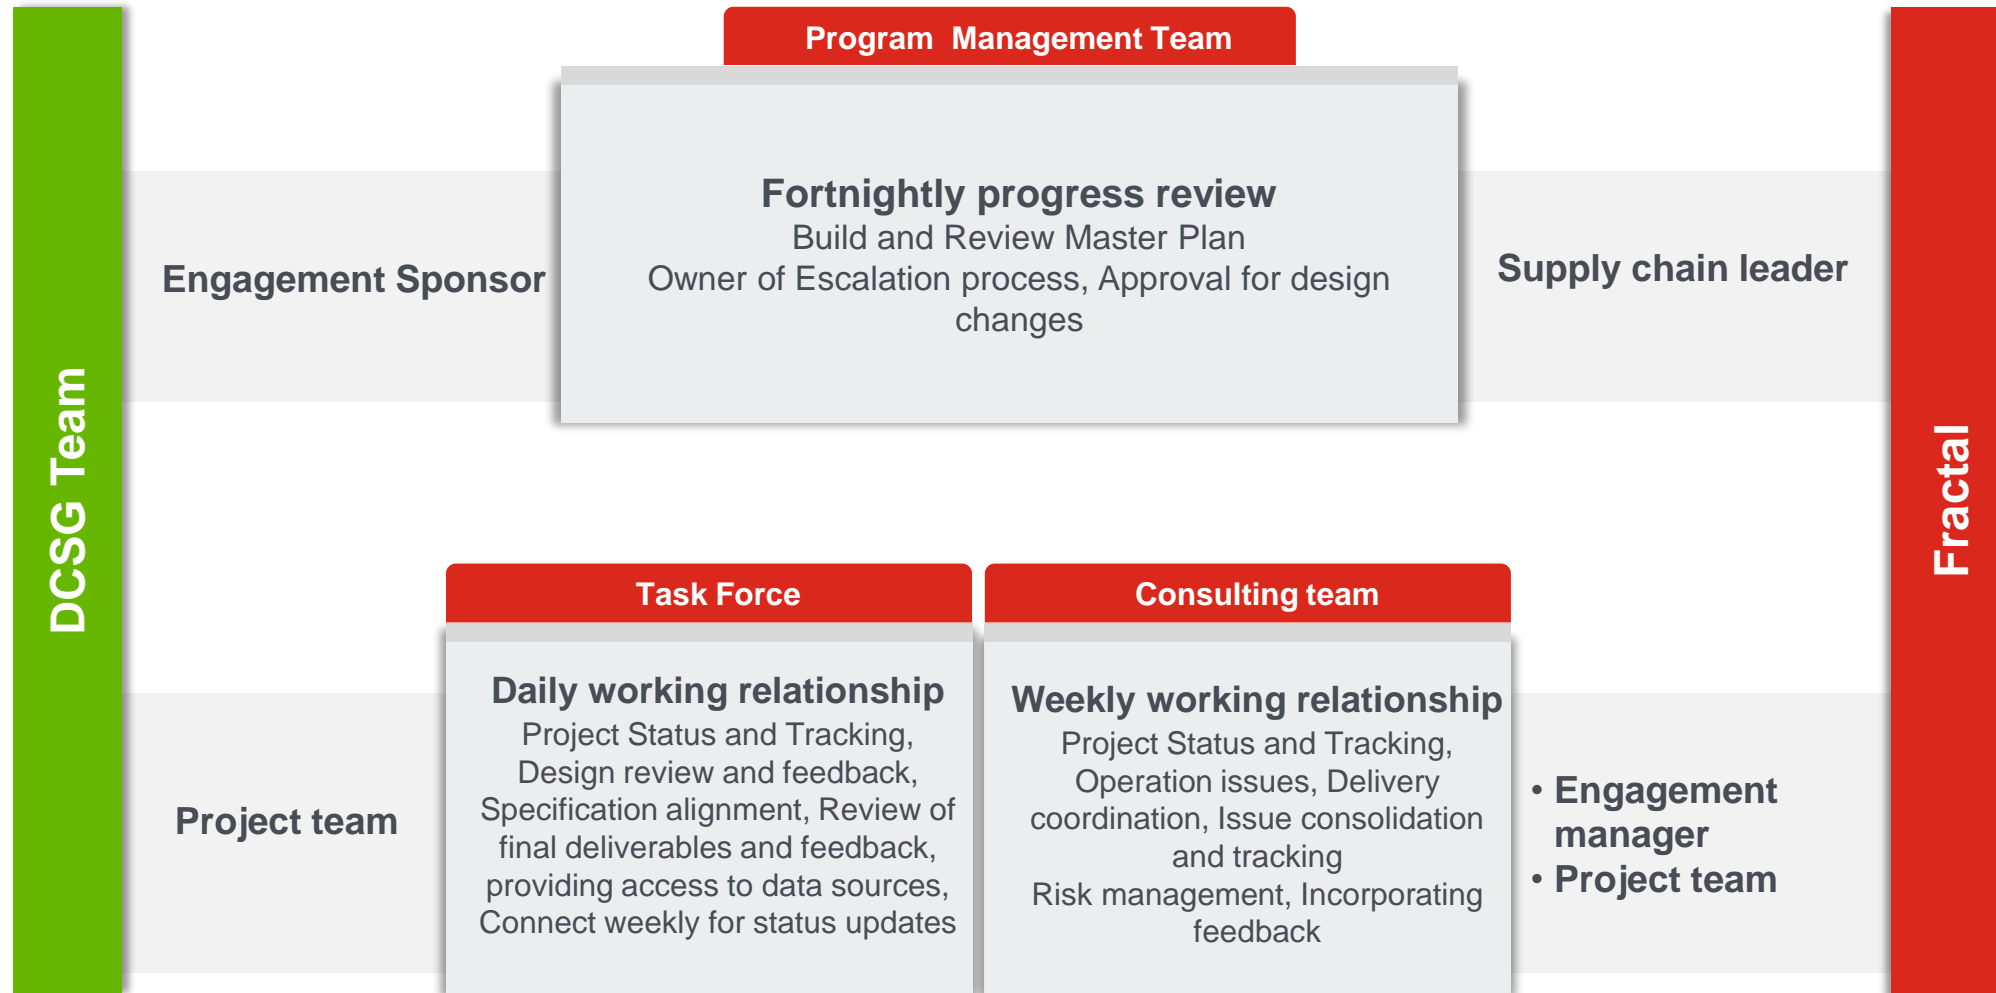

Terms & Conditions:

1. Does not include any taxes and duties, as maybe applicable
2. Does not include any cost of Travel & Expenses, which will not exceed 15% of the total project cost and need to be pre-approved by DCSG
3. Any change in deliverables or scope will have a direct impact on costs

DCSG will lead the business and program management, while Fractal acts as the extended team to deliver on the desired outcomes

Governance during Phase 1

Going beyond
Phase 1

Beyond Phase 1, here are a few potential use cases that can be explored during Phase 2

Use cases	3. Grouping orders for FTL shipments 4. Line items to be shipped in same delivery window	7. Optimize VFR for FTL/ LTL. 8. Optimize carrier selection	10. Determining the right DC with the right OH for the SKUs	11. Determining no. of trucks needed for next week demand 12. Determine optimal transit days
Potential Drivers/ input variables <i>(not exhaustive)</i>	<ul style="list-style-type: none"> Weekly OH inventory Shipments history Order line items Historical orders 	<ul style="list-style-type: none"> Transportation costs & fill rates Carriers/trucks capacity Historical shipments Available inventory Total demand & orders 	<ul style="list-style-type: none"> Annual demand Transit lead time Inventory unit cost of item Buying cost of item OH inventory at DC 	<ul style="list-style-type: none"> OH inventory Shipments history Replenishment frequency Future order volumes Carriers/trucks capacity
Analytical techniques & models	<ul style="list-style-type: none"> Product association rules Correlation between shipment frequency & association groups 	<ul style="list-style-type: none"> Composite rankings for carriers Bayesian techniques 	<ul style="list-style-type: none"> Inventory optimization by arriving at economic order quantity & re-order points 	<ul style="list-style-type: none"> Decision Trees like XGBoost, Random Forest Multilayer Perceptron
Output <i>(indicative)</i>	<ul style="list-style-type: none"> SKUs which can be shipped together to optimize truck load & maximize speed to customer Clubbing like orders 	<ul style="list-style-type: none"> Daily optimized truck load plans Best carriers based on optimized cost 	<ul style="list-style-type: none"> Min level or safety stock at DC Optimal OH inventory at DC Replenishment frequency at DC 	<ul style="list-style-type: none"> Weekly schedule of trucks & load capacity required based on demand and available inventory Recommend transit days for each order

Fractal Credentials in Supply Chain Analytics

Fractal has demonstrated expertise in delivering insights, impact and innovation across Supply Chain use cases (1/2)

80%

forecast accuracy

- Agile, scalable forecasts & consumption trends for 150+ markets and 70+ segments
- Growth drivers based, quantitative methods & FVA approaches

\$1Bn

savings through e2e inventory optimization

- Non performing inventory root causes & depletion recommendations
- Optimal safety stocks for maximized service levels
- SKU portfolio rationalization

\$25Mn

annual savings across transportation

- Transportation cost drivers
- Carrier rationalization for least cost carriers & consolidation
- Maximized capacity utilization of volume & weight fill rates

4%

Increased service levels

- Established Service level drivers and interdependencies
- Enabled Scenario planning to assess the service levels for distribution uncertainties

Fractal has demonstrated expertise in delivering insights, impact and innovation across Supply Chain use cases (2/2)

\$500Mn

reduction in sourcing costs

- Commodity price modelling
- Alternative sourcing choices
- Recommended purchase frequency and volume while reducing scrap risk

15%

CAPEX reduction in outsourced manufacturing

- Determined Optimal Capacity to Demand ratio
- Recommendations on Optimal presses & molds
- Scenario planning for Service levels

\$3Mn

savings with reduced off spec

- Predicted output product quality from sensory tags
- Reduced excess give away of nutrients
- Real time anomaly detection

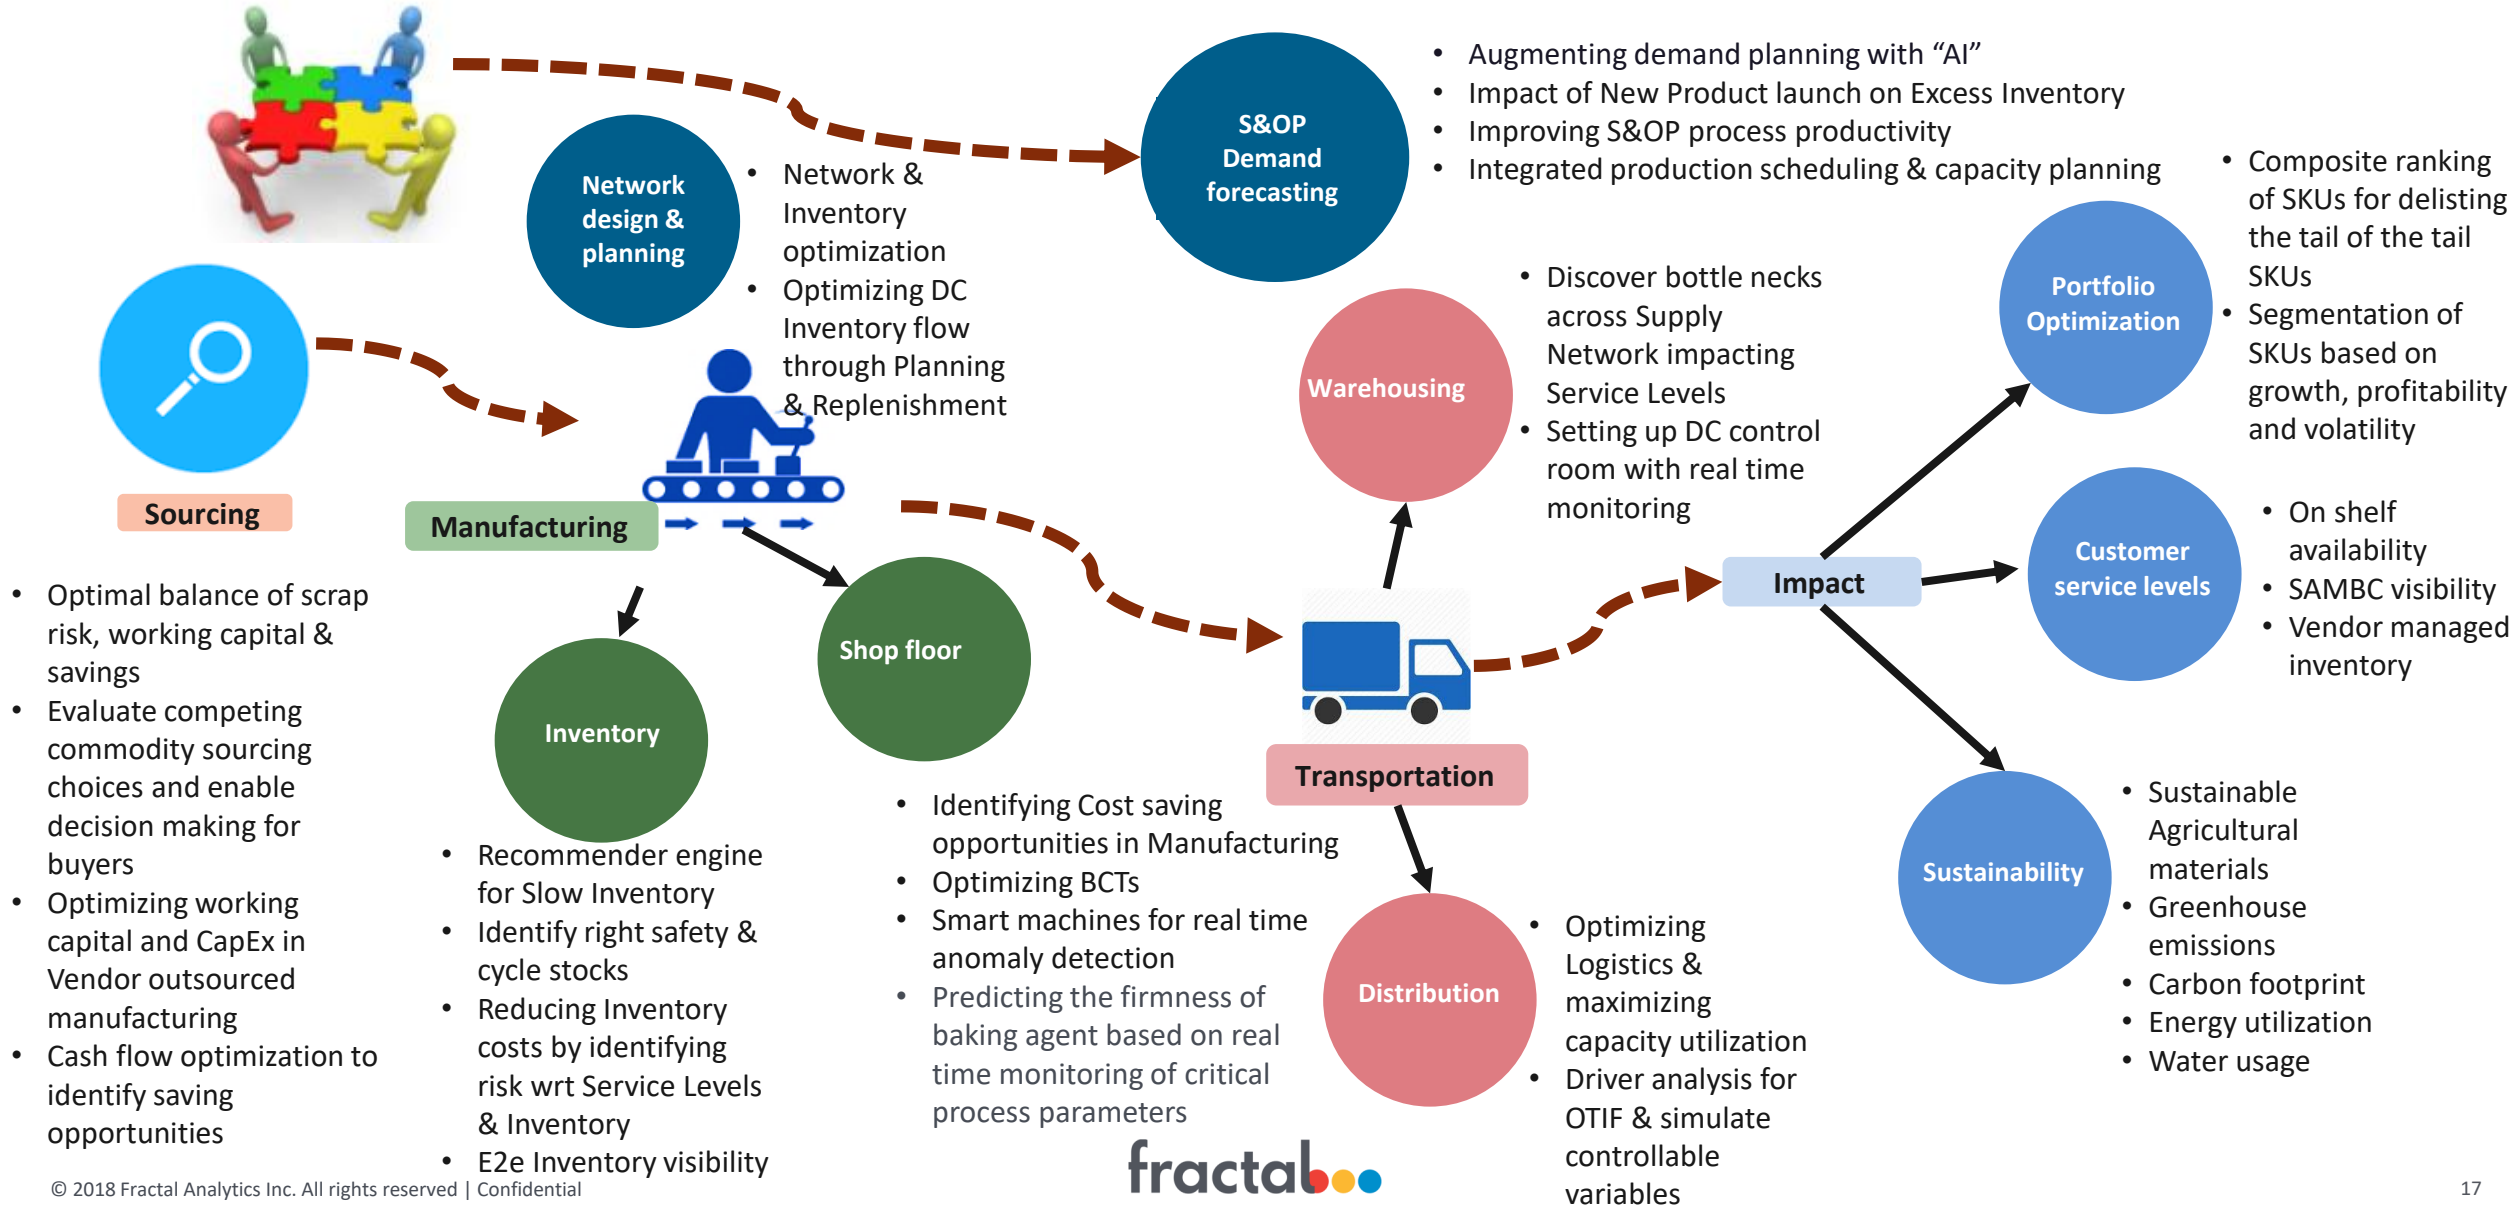

~5%

Reduction of total freight costs

- Reduced sub optimal shipments
- Enabled CPFR through allocation principles and replenishment strategies
- Identified right mix of Inventory at DCs

By solving complex challenges for our clients

: A strategic analytics partner to the most admired
: fortune 500 companies globally and helps them
: power every Human decision in the enterprise by
: bringing analytics & AI to the Decision.
